

DESIGNED BY OPERATORS FOR OPERATORS

Cloacina's package wastewater treatment plants are designed by operators for operators. Our Ownership Team has been building, installing, operating and maintaining water and wastewater systems for almost three decades. As a result, we know what operators and maintenance technicians need. Some of the revolutionary operations and maintenance-friendly features of our package wastewater treatment plants include:

Submerged sensory equipment is mounted on Cloacina's Slide Rail System which provides mounting and support of equipment requiring precise installation and repeated removal for calibration and maintenance. This allows multiple pieces of equipment to be installed in tight spaces without tension on or tangling of power cords and controls cables.

The MEMPAC-M has built-in foam migration to keep foam and scum moving through the system and into a trap at the end of the treatment train

All process tankage on the MEMPAC-M has isolation gates for maintenance and emergency purposes

Equipment has pressure gauges or transducers for troubleshooting

All equipment has unions and/or flanged fittings for easy access and maintenance

All equipment is visible and easily accessed, maintained and replaced

We offer more sensory equipment and monitoring points on our systems than any other manufacturer

All models include self-cleaning probes

Our controls program provides graphing, trending, charting and history

We provide built-in logic for oxygen control, nitrogen reduction and sludge management
